Subject: Re: [Rorschach_List] Difference between "resources available" and "intelligence"?

Gerald,

I think of M responses (and Sum M) not so much as an indicator of "creative thinking" as I do an indicator of the degree to which the individual is able to rely upon deliberate, volitional utilization of thoughts, ideas and attitudes to approach the day-to-day activities that life requires each of us to act upon or not. The degree of M in a protocol appears to be a read of the individual's ability to reflect thoughtfully on these day-to-day, or even moment-to-moment, occurrences. Some people are able to cogitate more reflectively to permit them to weigh alternatives before acting. WSumC folks appears to be more prone to rely on their present and perhaps past feelings rather intuitively as they approach the occurrences of day-to-day living, which than serves as their characteristic barometer for behaving subsequently.

By the way, does anyone know how to get their hands on Mihura's paper, which Groth-Marnat cites repeatedly in the new edition of his handbook, in which she provides some apparently meta-analytic data (?) that serves as the basis for which structural summary variables are supported minimally, moderately or strongly in the empirical literature?

Just my two cents in Chicago,

Steve
