

Clinical Scale Elevations

Scale(s) 7 (Pt)

T-score \$ 85

Elevations on the present Scale(s), taking race, gender, age, education, marital and employment status into consideration for the corresponding group's data indicate any or all of these clinical features could be present in this person's behavior and history:

They ruminate over difficulties, frustrations, and problems. They go over and over their problems, but rarely find satisfactory solutions for them. They feel miserable most of the time. They suffer from chronic tension. They sometimes find themselves so tied up in their own thoughts that they cannot make decision or attend adequately to everyday duties. They bear a heavy sense of responsibility, which is not called for by the objective facts of the situations in which they find themselves. They get little to no joy or satisfaction out of life. They are long suffering, as are their partners.

They are not considered "The Life of the Party." They find it hard to laugh. Life is too serious for them to bear the thought of anything racy, erotic, or improper. They are good, dependable, and reliable if not, inspiring neighbors. They are dependable. Their sense of morality demands exceptionally high standards, for both themselves and others. They are straight laced.

Many people would probably not want to go to lunch with them, unless job or social demands required it. They freeze when suddenly confronted with off colored jokes. They panic when faced with an insensitive "move" is placed upon them.
